ENVIRONMENTAL POLICY

ALUDEC, as a responsible member of both society and the automotive industry, is aware of its impact on the environment. As such, within the framework of a management system, we carry out our activity committed to environmental protection, pollution prevention, compliance with the applicable legal requirements or other environmental requirements to which we subscribe, as well as to adapting to society's new demands in terms of environmental sustainability.

The ALUDEC Group supports the United Nations 2030 Agenda action plan, committing to acting on environmental aspects that help achieve the Sustainable Development Goals (SDGs).

In this regard, we integrate the environmental management system throughout our organisation with a life cycle analysis approach that enables us to address environmental risks and implement economically viable methods that reduce our environmental impact throughout the life cycle stages of our operations, products and services.

To this end, this Policy constitutes the framework for the definition and implementation of relevant environmental improvement objectives for society, and thus, advancing the continuous improvement of environmental performance.

One of the fundamental pillars of this improvement is our commitment to ensuring all our employees respect the environment with appropriate training and awareness programmes, as well as motivating the members of our supply chain to adopt an environmental management system consistent with the following principles and commitments of ALUDEC:

Circular economy and waste management

Actively collaborate in the transition from linear to circular consumption of resources; promote the use of recycled and/or renewable raw materials; and reduce, reuse and recycle the waste generated.

Water and natural resources management

 Promote the responsible use of natural resources such as water, optimising its consumption and preventing it from becoming polluted after use.

Responsible management of chemicals and restricted substances

 Manage the chemicals used safely and responsibly and actively work on identifying and gradually substituting any restricted substances identified in our process/product.

Air quality

 Adopt available and technically feasible technologies in manufacturing processes in order to minimise the impact on air quality in the areas of activity and to control pollutant emissions, both atmospheric and acoustic.

Energy efficiency

 Contribute to energy efficiency by monitoring and encouraging the reduction of energy consumption and promoting the use of renewable energy sources.

Climate change: greenhouse gas (GHG) emissions

- Contribute to the challenge of climate change by promoting a low-carbon economy and developing strategic objectives in line with the Paris Agreement and efforts to limit the global temperature rise to 1.5°C.
- Promote transparency by informing our stakeholders of our environmental sustainability performance and especially in relation to our contribution to tackling climate change.

Responsible land use, biodiversity and animal welfare.

Carry out our activities with consideration for biodiversity and animal welfare in their ecosystems and habitats, and prevent any detrimental modification of the land we occupy.

This environmental policy and the organisation's environmental management system shall be reviewed and updated to ensure its compliance and effectiveness.

In short, ALUDEC is committed to carrying out its industrial activity in an environmentally friendly manner and to making rational use of natural resources in order to contribute to sustainable development.
